

Volcano Eruption Experiment

Answer the following questions after doing your experiment. (You will need a watch with a second hand)

1. Did you use exact measurements for conducting your experiment?

2. How long did it take for the chemical reaction between the vinegar and baking soda to take place? (The point at which the “eruption” is visible and spilling out of the bottle)

3. Was your experiment a success? Why or why not?

4. Which experiment worked better? The one with the estimations or the one with the exact measurement?
